It gives me great pleasure to transmit this report on the fourth annual **Residential Property Survey**. Effective management requires ongoing monitoring of the organization's performance. While each administration understands very well the forces that drive it in setting the pattern for financing its local government operations, assessing how the community is doing in a wider context is often difficult. The purpose of the **Residential Property Survey** is to provide comparable information on every municipality to assist councils and administrations in evaluating their activities relative to raising of funds from the residential tax base.

A major change was made in the approach to preparing this year's report. This year's survey has been developed primarily from information already provided to Alberta Municipal Affairs through the filing of annual financial reports and population affidavits. This year we did not conduct a questionnaire survey to obtain information on taxation and assessment for a "standard residential property" as was done in previous years.

It must be acknowledged that this approach offers both advantages and problems to the user. Most information is presented on a "per dwelling unit" base and it must be recognized that dwelling units are not the same from municipality to municipality. The size, age, and type of dwelling units will vary between municipalities and thus there is a risk of comparing "apples and oranges." This problem can be minimized by working through the three steps in the User's Guide. As a result, you can more realistically select municipalities for comparisons and can have confidence in the compatibility of the data reported in the 1987 Alberta Municipal Financial Information System (AMFIS).

I would suggest, therefore, that you accept the data at face value, paying particular attention to the main User's Guide as well as the comprehensive introductions to each component of the survey report. These will lead you to a stronger appreciation of the qualities and constraints associated with each set of data.

As always, I would welcome your comments and constructive criticism on the survey report and its value to your work.

John McGowan, Executive Director

USER'S GUIDE

THE USER'S GUIDE TO THE 1988 RESIDENTIAL PROPERTY SURVEY

1. Introduction

No two municipalities are the same. This report has been developed to enable you to make meaningful comparisons of residential property assessment, taxation and utility charges. Assumptions need to be made to make comparisons among the data and among municipalities. This User's Guide and the introductions direct your attention to the factors causing variability in the data. In turn, you are better able to attach confidence and meaningfulness to your comparisons. This report differs from the previous reports (1985 to 1987) in two fundamental ways. First, the data is usually expressed as a statistic using a "**per dwelling unit**" base (hence per D.U.). In previous reports, specific data on a selected "standard" 3 bedroom bungalow was used. Also, data for rural municipalities are not comparable to data from an urban municipality. For example, total municipal property tax in a rural municipality includes farm taxation as well as residential taxes.

The contents of this report are structured using the following line of reason:

User's Guide — Most readers will want to know the general rules and assumptions about the data being reported. Also, to be able to tap into the wealth of this data, you will have to begin with comparable municipalities. Hence, three steps to selecting municipalities for comparison are proposed, and a set of data is provided in the User's Guide to assist in this process.

Part I — Further confidence in your comparisons can be gained with specific reference to the statistics in Table I. Those dealing with the rural municipalities will find the data in Appendix 1 useful in confirming municipal similarities and differences.

Part II — Now that you have selected several comparable municipalities, the variation in total taxes can be identified in Table II, along with the equalized mill rate equivalents. This taxation burden can be related to measures of the municipality's fiscal capacity and household income.

Part III — The two major components of total residential property taxes are municipal and school taxation. Both are detailed in Table III. Appendix 2 provides additional school jurisdiction specific data.

Part IV — As residential taxpayers in urban centres know, municipalities usually levy other charges — the largest usually being for utilities. The primary municipal utilities are water and sewer and, to a lesser extent, solid waste collection and disposal. Annual charges are reported along with operating cost and debt load information for these three utilities.

In short, the layout of this report encourages the use of comparable municipalities as a means to identify and explain variations in taxation and utility charges. You can also use this report to conduct meaningful comparisons with neighbouring municipalities.

2. Presentation of Data

The data in the tables has been largely taken from AMFIS. Other sources are noted in the introduction of each Part. As your will read, this report consists largely of data. The use of consistent presentation techniques helps to make your comparisons even easier. For example, municipalities are arranged by population, highest to lowest. Also each municipal type (e.g. Towns) has been divided into groups of about 30 municipalities. At the bottom of each page, **two averages** are presented. The **first average** is for the group of municipalities found on that page. The **second average** is for all municipalities of the same "status" (e.g. all the Towns)

For towns, villages and to a lesser extent for summer villages, these groupings on each page are particularly convenient for municipalities located around the middle of each page. Those at the bottom or the top of the pages may wish to consult the appropriate municipalities on subsequent or previous pages.

Another "user friendly" feature in the introduction of each Part is an illustrated **User's Note**. As a quick reference, a summary of the data by municipal types is presented. These notes also help you to use the data and how these statistics are calculated.

3. Steps to Comparability

By completing the following steps you can select similar municipalities (besides just population) which in turn will

increase confidence in your comparisons. Please refer to the end of this User's Guide, where the data has been compiled to help you to more easily complete these steps.

STEP 1: First consider whether the Residential Equalized Assessment per Dwelling Unit is similar. For details about this indicator see the introduction to Part I.

STEP 2: Secondly, ensure the municipalities that you are comparing have similar types of taxes and charges. You should be comparing municipalities which levy similar types of taxes. For example, comparable municipalities should either all have, or not have, special levies or utility charges.

The comparability of taxation levels in a municipality may be influenced by any one or more of the following factors:

i) the currency of the property assessment value, and/or
ii) the presence or absence of special assessments and local improvements, (e.g. special municipal levies) and/or
iii) the incidence of extraordinary or other special requisitions, (e.g. by a hospital district authority).

Any remaining variability can be interpreted as being a function of differences in:

i) the range of municipal services supported by taxes;
ii) the level at which these services are provided
iii) the method of service-delivery, (e.g. volunteers/ community associations, or full-time municipal staff; private contractors or municipal staff); and
iv) the financing approach, (e.g. general benefit versus property-owner benefit, and the associated tax burden; or pay-as-you-go capital works financing versus debenturing).

The general fiscal policies of a municipality may also have a significant bearing on the level of taxation. No attempt has been made to gauge such service-profile/financing strategy detail. However, its importance should be borne in mind when making comparisons between municipalities.

STEP 3: Thirdly, ensure the municipalities are similar. This is done by using the municipality-wide data and indices found in Parts I to IV. These statistics include fiscal capacity indicators, assessment mix, and taxation level indicators. Refer to the introduction of each Part and the Appendices for any particular details on the indicators.

4. Alphabetical List of Municipal Populations

The data in Parts I to IV are presented by municipality from highest to lowest population. To assist you in finding the population of a particular municipality, refer to the table at the end of this User's Guide. Rural municipalities are ordered by the percentage of the total dwelling units associated with farms (assuming one dwelling unit per farm).

5. School Jurisdictions

The Supplementary School Requisitions data, in Table III, represents an aggregate of all these requisitions levied by all the school jurisdictions operating within the municipal boundaries. As such, this data can not be directly attributed to a single school authority. However, a code to identify the dominant school jurisdiction in the municipality is presented in the last column of the tabulated information included in this User's Guide. The code may be used to access comparative data on individual school jurisdictions presented in Appendix 2. The appended data enables you to gain an appreciation of all school jurisdictions. This includes aspects of the scale of operations, assessment mix and extent, fiscal capacity and expenditures.

The designation of a **predominant school jurisdiction** for each municipality was based on the one claiming the largest part of the municipality's equalized assessment. In most cases the dominant school jurisdiction was obvious. However for rural municipalities, especially in the improvement districts and special areas, there were several jurisdictions of similar size. This meant in some cases the reported jurisdiction accounted for a relatively small portion of the total assessment base.

The structure of the school jurisdiction code used by Alberta Education involves a prefix — from 1 to 6 — before the decimal point. These numbers refer to the Alberta Education Zone. The first digit after the decimal point identifies one of the following eight types of school authority:

1. School Division
2. County
3. Public School District
4. R.C. Separate School District

5. Consolidated School District
6. R.C. Public School District
7. Protestant Separate School District
8. Regional School District

The remaining three digits identify the specific jurisdiction under each status group heading. These three digits are complemented by a publicly recognizable number.

Examples:

5.3030: Zone 5: Calgary (Public) School District No. 19.
3.2190: Zone 3: County of Strathcona No. 20.

6. Utility Rates Survey

The data featured in Table IV is from a survey of all Cities, Towns and Villages. These municipalities were provided with their reported 1987 annual utilities charges for a standard volume of water, sewer and solid waste disposal service. In turn, they reported back any changes made to these charges. The survey obtained a 100% response rate.

7. Technical Notes and Abbreviations

The following notes help clarify some of the data in the tables and assist you with interpretation. Listed below are considerations which apply generally to several tables and the statistical data.

Averaging: The municipalities are listed in order of population size (highest to lowest). Each page has about 30 municipalities which are considered a group. An average is calculated for each page. An overall average is also reported which means the average of all municipalities of the same status (for example, all towns). In all cases, the average is calculated only for the municipalities reporting data. In some cases, an average was not reported because very few municipalities reported the charge or a non-zero value. In such cases, reporting an average could be statistically misleading.

Blank spaces, or 0 in the tables: A blank space implies that no data was available and a 0 indicates that a 0 was the reported value (e.g. level of charges for solid waste disposal).

Dollar amounts: All dollar amounts refer to 1987 nominal or current dollars as reported by the municipality. The exceptions are utility charges which were reported in 1988 and the Median Income data which is derived from 1986 income tax data.

Standard measure and conversions: Metric is the standard unit of measure found in this report. The following are conversion factors into the Imperial measure for area and volume:

one hectare (ha) = 2.47 acres or 10,000 square metres
one acre (ac) = 0.4 hectares
one metre = 3.281 feet
one foot = 0.305 metres
one square metre (sq. m) = 10.764 square feet
one square foot = 0.093 square metres
one cubic metre (cu. m) = 220 gallons
1000 gallons = 4.55 cubic metres
All of the above conversions are approximates.

Abbreviations and Short Forms: Both are found throughout this report. Refer to the introductions of each Part and the Appendices for an explanation of the abbreviations and short forms found in the tables.

Any and all suggestions, comments or other queries relating to the survey should be directed to:

PART I:

BASES FOR COMPARISON

PART I: BASES FOR COMPARISON

Introduction

The information in Table I helps you select similar municipalities for comparison purposes. Throughout this report major sets of data are expressed in a "per dwelling unit" base. This necessarily adds some uncertainty to making comparisons since it is probable that an "average dwelling" will vary among municipalities. The size, age, value and mix of housing types will all affect assessment and this will influence the level of taxation.

However a number of factors will permit effective use of these per dwelling unit statistics. Firstly, housing mix and size tends to be similar among municipalities with similar population levels. Similar measures of average assessed value imply a similar mix and/or size and age of housing. An additional measure of the composition of the housing stock is found in occupancy rates (population per dwelling) where lower occupancy rates usually indicate a higher proportion of multiple family housing. In rural areas, there is often housing in hamlets, on country residential acreages and on farms. Combined, these make the per dwelling measure subject to variation. It was observed that there was a closer relationship among municipalities with a similar proportion of farms than between municipalities with a similar sized population. Thus comparable municipalities can be identified by having similar Population size and similar Residential Equalized Assessment Per Dwelling.

Table 1 provides these statistics in the first two columns: 1988 **Population**, and 1987 **Residential Equalized Assessment per Dwelling Unit (R.E.A.P.D.U.)**. The R.E.A.P.D.U. measure is generated by reference to the portion of total equalized assessment which is "not" subject to the School Foundation Program Fund Levy. It is suspected that as this number increases so does the average quality of residential development in the municipality and/or the higher is the proportion of single family housing in the total housing stock.

Total Property Tax Per Dwelling Unit (TPT/DU or TPT) is an overall measure of property taxation. For urban municipalities this statistic includes residential taxes, special levies and mobile home fees divided by the total number of dwellings. In rural municipalities this measure includes the above aspects plus farm taxation. In summer villages the calculated taxes (revenues) are the same as for urban municipalities. However the average is calculated based upon the number of "occupied lots" rather than the number of dwelling units.

The statistic **Median Household Income** 1986 (H.M.I.) was derived from the publication "Urban FSA and Rural Postal Code Summary Data," Statistics Canada 88-004. You should be aware that postal code areas do not necessarily have the same boundaries as the municipality. As a result the income figures, particularly for the smaller urban centres, can be affected by the number of rural residents served by the same postal stations. The median taxable income value for the postal area for each municipality was multiplied by an Alberta wide average factor of 1.55 tax filers per dwelling in order to estimate the H.M.I. This statistic should not be used as a definitive measure of local income, but rather as an indicator of comparative taxpayer wealth between municipalities. It should be remembered that "median income" means that 50% of the tax filers will have less than the median income and 50% will have more. This measure can be of use in selecting communities for comparison since ability to pay does influence housing choice and the demand for, and ability to pay for, public services.

Comparisons can be made of the economic structure of the municipality by examining the composition of the local tax base. It is generally accepted that municipalities with higher proportions of Industrial and Commercial assessment are better able to sustain public services. For a municipality this is measured by the **Equalized Assessment Mix** (tax base) subject to the School Foundation Fund Levy. This measure is noted for the years 1983, 1986 and 1988.

Residential taxes are sensitive to changes in the total assessment base. A growing base brings the prospect of lower taxes, or better/more services for the same outlay. A shrinking assessment base means the likelihood of higher taxes simply to maintain the status quo, or cuts in the level and range of services

to keep tax rates stable.

The **Equalized Assessment Growth** information is presented for three periods: the past five years (1983-88); the past two years (1986-88); and the past year (1987-88). For the province as a whole, equalized assessment exhibited high annual growth rates until about 1983/84. Since the mid 1980s it has either declined or had very modest increases. When interpreting individual cases the possibility of large changes due simply to annexations, or general re-assessments, should be borne in mind.

PART I: BASES FOR COMPARISON
USER'S AND TECHNICAL NOTES

- Basic Comparisons: Identify municipalities of similar population size and similar residential equalized assessment per dwelling for comparison.
- Housing mix and size often tends to be similar among municipalities of a similar population size.
- Residential equalized assessment per dwelling roughly indicates the average quality of residential development. Generally, the higher the R.E.A.P.D.U., the better the average quality of residential development, and/or the higher is the proportion of single family housing in the total housing stock.
- Compare the total property tax burden on the average dwelling unit.

- Lower occupancy rates — population per dwelling unit — usually indicate a higher proportion of multiple family housing in the housing stock.
- Use median household income as an indicator of comparative taxpayer wealth, which influences housing choice and the demand for, and ability to pay for, services.

- The equalized assessment mix indicates the industrial/commercial proportions of a municipality's tax base. Generally, the greater this percentage, the lower will be the residential taxes for the same "basket" of municipal goods and services.

- Equalized assessment trends can help you appreciate the taxation situation. A growing assessment base could mean lower taxes or the same service levels. A declining base may be accompanied by higher taxes and/or cuts in services.
- Large changes from one year to the next may be due to annexations or general re-assessments.

- Alberta Municipal Affairs (October '88)
- Urban municipalities are listed by decreasing population. Rurals are sorted by the proportion of farms to the total dwelling units.
- The User's Guide provides an alphabetical listing of municipalities.

- From AMFIS

- The industrial/commercial portion of the equalized assessment, subject to the School Foundation Program Fund levy is presented for the years 1983, 1986 and 1988.

- The percent change in total equalized assessment over the three periods is indicated. Decreases are shown by a (–).

- Calculated from 1986 median taxable income data compiled by postal zone by Statistics Canada; multiplied by 1.55 tax filers per dwelling provincial average for Alberta. This information is not available for summer villages.

- Refers to that portion of the total equalized assessment in a municipality that is not subject to the School Foundation Program Fund levy. This portion is divided by the number of dwellings.

- This information is not available for summer villages.

- Includes residential taxes, special levies, and mobile home license fees (as well as farmland taxes in the case of rural municipalities); divided by the number of dwellings. In summer villages, the average is calculated for the number of occupied lots rather than for dwelling units.

PART II:
TOTAL TAXATION

PART II: TOTAL TAXATION

Introduction

Featured in Part II are the Total Property Taxes per Dwelling. **Total Property Taxes per Dwelling (T.P.T./D.U.)** includes general municipal taxes, all school requisition taxation, special property-assessment-based municipal levies or charges, and the taxes necessary to cover other requisitions such as those for planning, hospitals and nursing homes divided by the total number of dwellings in the municipality. For rural municipalities, this measure includes revenues from farm taxation. This is because the available information does not differentiate between farm and non-farm dwellings. Accordingly, no comparison should be made between a rural and urban municipality using Total Property Taxes. It should also be noted that the rural municipalities have been arrayed in order of the percentage of total dwellings which are farms. Thus, comparable rural municipalities should have a similar mix of farms and non farms.

The **TPT Index** indicates the level of taxation for each municipality relative to the group average. In addition, the index relates to information for an "average" dwelling unit. This may not necessarily apply to all properties in aggregate — either within the broad residential category or among all land use categories (e.g.industrial, commercial).

The **Total Equalized Mill Rate (T.E.M.R.)** expresses the grand total of property taxes and grants-in-lieu received by a municipality divided by the total equalized assessment. This measure is a generalized total or aggregate rate, lumping together all types of property. The statistics presented employ 1987 financial statement data derived from the Alberta Municipal Financial Information System (AMFIS) and 1988 equalized assessments (prepared annually by the Assessment Equalization Board). Because of the complexities of the equalization process, equalized assessments for a given year reflect the actual assessment situation prevailing about two years previous.

The **Residential Equalized Mill Rate (R.E.M.R.)** is a more specialized equalized mill rate. It deals only with the residential and farmland properties in aggregate. Such property is often favoured by lower rates. Businesses may be subjected to higher rates under a split mill rate situation, as well as having to pay the School Foundation Program Fund Levy. The equalized residential plus farmland mill rate are computed by isolating all taxes raised from residential and farm properties including mobile home licence fee revenue, and special property-assessment-based revenues. These taxes are expressed as an equalized mill rate by reference to that part of total equalized assessment which is not subject to the School Foundation Program Fund Levy.

Fiscal Capacity statistics furnish the best readily available indicators of the relative ability of any given municipality to provide a standard "basket" of municipal goods and services, for any given standard level of taxation. Table II provides two measures of property assessment-based fiscal capacity.

Equalized Assessment Per Dwelling Unit (E.A.P.D.U.) relates the amount of assessment to the number of dwelling units — the major source of demand for services in virtually all municipal settings. The net costs involved ultimately require taxation which has to be raised from the available assessment base. This base may consist of varying proportions of commercial, industrial and institutional property as well as the predominant residential (and farmland) property. The larger the assessment base overall, and the greater the non-residential portion, the more likely it is the resident will pay average or below average taxes. This could be in terms of the prospects for comparatively low levels of taxation, or better service levels. The **E.A.P.D.U. Index** values show at a glance how each municipality is positioned in terms of property-based fiscal capacity. The **Assessment Mix** aspects were detailed in Part I.

The **Residential Equalized Assessment Per Dwelling (REAPDU)** is another specialized measure discussed in Part I. As noted previously, this measure can serve as a comparative indicator of the relative quality of the housing stock between municipalities.

Another perspective on a municipality's fiscal capacity can be obtained by reference to personal income levels. These have a bearing on taxation capacity as well as indicating what may be driving a particular stance on service levels.

Table II includes the derived estimate of income per dwelling

unit (**Household Median Income**) and the related **Index**. The Household Median Income refers to the median income of all tax filers reporting income in each urban municipality multiplied by 1.55 tax filers per dwelling unit. This measure has been indexed for each group and provides a quick measure of "ability to pay" among municipalities.

For the rurals, no municipality-wide median income was reported. However, a weighted average has been computed based on the published data for small areas within each rural municipality. As a result, these income based measures should be used with some caution.

A question always of concern to councils and administrations is the "ability of the residents" to pay for existing or proposed services. The final measures on this table provide some tentative insights into these questions.

The Total Property Tax Per Dwelling Unit (T.P.T./D.U.) has been expressed **as a percentage of the Household Median Income**. Relatively high or low percentages may provide an answer to the degree of flexibility that the Council may wish to exercise in taxing. The **Index** of this measure indicates how far each municipality diverges from the average for its group and class of municipality. The user is cautioned in using these measures to consider carefully the comparability of the municipalities under consideration. Also, these income measures are less reliable for the smaller urban municipalities because of the influence by rural tax filers.

PART II: TOTAL TAXATION
USER'S AND TECHNICAL NOTES

- Compare Total Property Tax per Dwelling Unit using the $ amounts or the index relative to the group averages at the bottom of the page.
- These mill rates are for the entire municipality.
- The R.E.M.R. Index should be generally similar to the T.P.T. Index.
- These property tax-base indicators show the relative ability of a municipality to provide a standard "basket" of goods/services for a standard level of taxes.
- The higher the E.A.P.D.U., the better off the average residential taxpayer.
- Compare Actual as well as Index figures with the averages.
- R.E.A.P.D.U. roughly indicates the average quality of residential development.
- Use Household Median Income as a measure of taxpayer wealth and ability to pay for services.
- Use Total Property Tax as a percentage of Household Median Income as an indication of the burden of taxation on the local taxpayer.

Municipality	Average Taxes/Dwelling		Comparative (Equalized) Mill Rates				Fiscal Capacities: Property-based				Household Income		Burden of Taxation

- Use the municipality's population to locate it in Parts I to IV. Urban municipalities are listed by decreasing population. Rurals are listed by the proportion of farms to the total dwellings.
- The User's Guide has an alphabetical list of municipalities.
- Total property tax includes taxes from requisitions, special assessment levies, and general municipal purposes divided by the number of dwellings. Farmland taxes are included for rural municipalities. For Summer Villages, the number of parcels with residences was used instead of dwellings.
- Total property taxes and grants-in-lieu of a municipality divided by its total equalized assessment.
- Special mill rate for all taxes from residential (and farmland) properties (incl. mobile home license fees and special assessment revenues) divided by the total residential (non-SFPF) equalized assessment.
- Total equalized assessment of a municipality divided by the total dwellings. For Summer Villages, the number of parcels with residences was used instead of dwellings.
- Residential (non-SFPF) equalized assessment divided by the dwellings in a municipality.
- Calculated from 1986 median taxable income data by postal zone compiled by Statistics Canada, multiplied by 1.55 tax filers per dwelling provincial average for Alberta.
- Total property tax per dwelling as a percentage of household median income.

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

PART III:

MUNICIPAL AND SCHOOL TAXATION

PART III: MUNICIPAL AND SCHOOL TAXATION

Introduction

Table III features the municipal and school taxation components of total property taxation and their mill rate equivalents. The municipal taxes encompass both general municipal taxes and special municipal levies. The latter element is highly variable and deserves to be closely monitored in any comparisons.

Municipal Taxes and other (Non-School) Requisitions have been calculated on a per dwelling unit basis and are **Indexed**. The majority of these monies are raised from residential properties, which are spent on the provision of public services. Generally, less than 5% of these monies are collected for other (non school) requisitioning authorities. (See the User's Guide for details.)

In many municipalities, **Special Levies** are not used. In others, they may play a major role in the allocation of particular service costs to specific benefitting properties. For this report, an assumption has been made that all special levies are associated with residential properties. It is acknowledged that this is not in fact true, but it seems that the majority of these charges are generally levied against residential land uses. Even in those municipalities using special levies, it is probable that many properties are not burdened with this tax. Consequently, those subject to the tax will pay much more than the averages shown in this table. In short, the reported special levies are conservative estimates of the burden of this tax on specific properties.

Municipal taxation is not always the major component of total property taxation: this status occasionally applies to supplementary school taxation.

School taxation refers to the **Supplementary School Requisition (S.S. Req./D.U.)** elements of the total property tax bill. These requisitions are collected by the municipality for the local school jurisdiction(s). The statistic S.S. Req./D.U. is obtained by multiplying the total of all supplementary school requisitions by the proportion of equalized assessment which is exempt from the School Foundation Program Levy and dividing by the number of dwelling units. This measure reflects the average supplementary school requisition per dwelling, irrespective of the specific levying school jurisdictions. Where several school jurisdictions are involved it is possible that similar residential properties will be subject to different supplementary requisition amounts. This amount will also vary depending on what school jurisdiction the tax-payer has opted to support.

The **S.S. Req. Index** enables a quick appreciation of the position of individual municipalities in relation to the group average. The percentage statistic (**S.S. Req. as a % of T.P.T./D.U.**), and the **Index** indicate the relative significance of school taxes in the total property tax bill. Appendix 2 contains more specific data on the school jurisdictions for comparative purposes.

The **Municipal Taxation Equalized Mill Rate, (M.T.E.M.R.)** was generated by referencing the 1987 "Balance of Levies for Municipal Purposes." This is converted to a mill rate equivalent by using the total 1988 equalized assessment. This statistic is also **Indexed** for quick comparisons. It should be noted, this equalized mill rate involves a reference to all types of property and not just to residential property.

For a broader perspective, an equalized mill rate (**S.S.R.E.M.R.**) has been computed using the total 1987 supplementary school requisitions for each municipality expressed as a mill rate of 1988 total equalized assessment. It represents an aggregate situation, embracing all supplementary school requisitions, by every supported jurisdiction, and all taxable properties.

In both of the above cases, an equalized mill rate provides a broader municipal reference point for comparisons rather than just the levels of taxation. These mill rate equivalents reflect the relative significance of the municipal and school taxes in relation to a municipality's property wealth base — its equalized assessment. For instance, you may determine that either of these taxes per dwelling unit is high compared to another municipality. If the corresponding equalized mill rate is also above the average, then you may conclude that the taxes truly are significantly higher than those in the municipality which is under comparison.

PART III: MUNICIPAL AND SCHOOL TAXATION
USER'S AND TECHNICAL NOTES

- Compare Municipal Taxes per Dwelling Unit using the $ amounts or the indices relative to the group averages at the bottom of the page.
- Ensure municipalities being compared have a similar mix of taxes and charges. Special levies can be very significant in some cases, and insignificant or absent in other instances.
- Supplementary School Requisitions columns indicate the significance of school taxes in the total property tax. Either supplementary school requisitions or Municipal Taxes form the single largest component of Total Property Taxes.
- The equalized mill rates reflect the relative significance of municipal and supplementary school taxation in terms of the comparative burden this taxation places on the equalized assessment — the municipality's property wealth base.
- The equalized mill rates provide a broader municipal reference point for comparisons than in the case of the levels of taxation.

Municipality	Municipal Taxation and Indices				Special Levies and Index		Supplementary School Requisitions and Indices				Equalized Mill Rates and Indices

- Municipal taxes are levied for projects/expenditures benefitting most or all of the municipality. Also included are non-school requisitions. These are taxes collected by the municipality on behalf of regional and provincial authorities (e.g. Provincial Planning Fund, auxiliary hospital districts, nursing homes).
- Municipal taxes (including non-school requisitions) are expressed as a percentage of total property taxes divided by the dwelling units in a municipality.
- Frontage charges and local benefit assessments to specific property (e.g. for sidewalk improvements) divided by the total dwelling units.
- Supplementary school requisitions collected by the municipality on behalf of the requisitioning school jurisdiction(s) divided by the dwelling units.
- Supplementary school requisitions as a percent of total property tax divided by the dwelling units.
- "Balance of Levies for Municipal Purposes" (AMFIS) divided by the total equalized assessment for the municipality.
- Total supplementary school requisitions (AMFIS) in a municipality divided by the total equalized assessment.

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

PART IV: UTILITY CHARGES

PART IV: UTILITY CHARGES

Introduction

Utility charges comprise a significant portion of the direct costs for a residential property-owner. This is particularly the case for urban households. **Total Aggregate Costs per Dwelling Unit (T.A.C./D.U.) are the combination of total property taxes per dwelling unit (T.P.T./D.U.) and total utility charges (T.U.C./D.U.)**. For quick comparisons **T.A.C.** has been Indexed.

Table IV features cities, towns and villages. Elsewhere, utility charges are of little or no significance for most rural municipalities and summer villages.

Of all utility charges, Table IV includes those associated with **water supply, sewer service** and **solid waste management**. The combined influence of these utility charges, in relation to total aggregate costs, is shown in the table (**Utility Charges as a % of T.A.C.**). The comparative significance is brought out in an associated **Index**.

The annual charges developed for these three municipal utilities are indicated in the table. In the cases of water and sewer the amounts were derived by applying the reported rates of charge to a **standard volume of water consumption**. Relatively few municipalities levy solid waste management service charges. Where present, they are usually annual flat-rate charges.

The AMFIS data have been used to assist in an appreciation of the diversity of utility financing practices among municipalities. The **per capita net operating loss or gain** associated with each utility is indicated. If the self-financing principle was adhered to, all the statistics would be very close to zero.

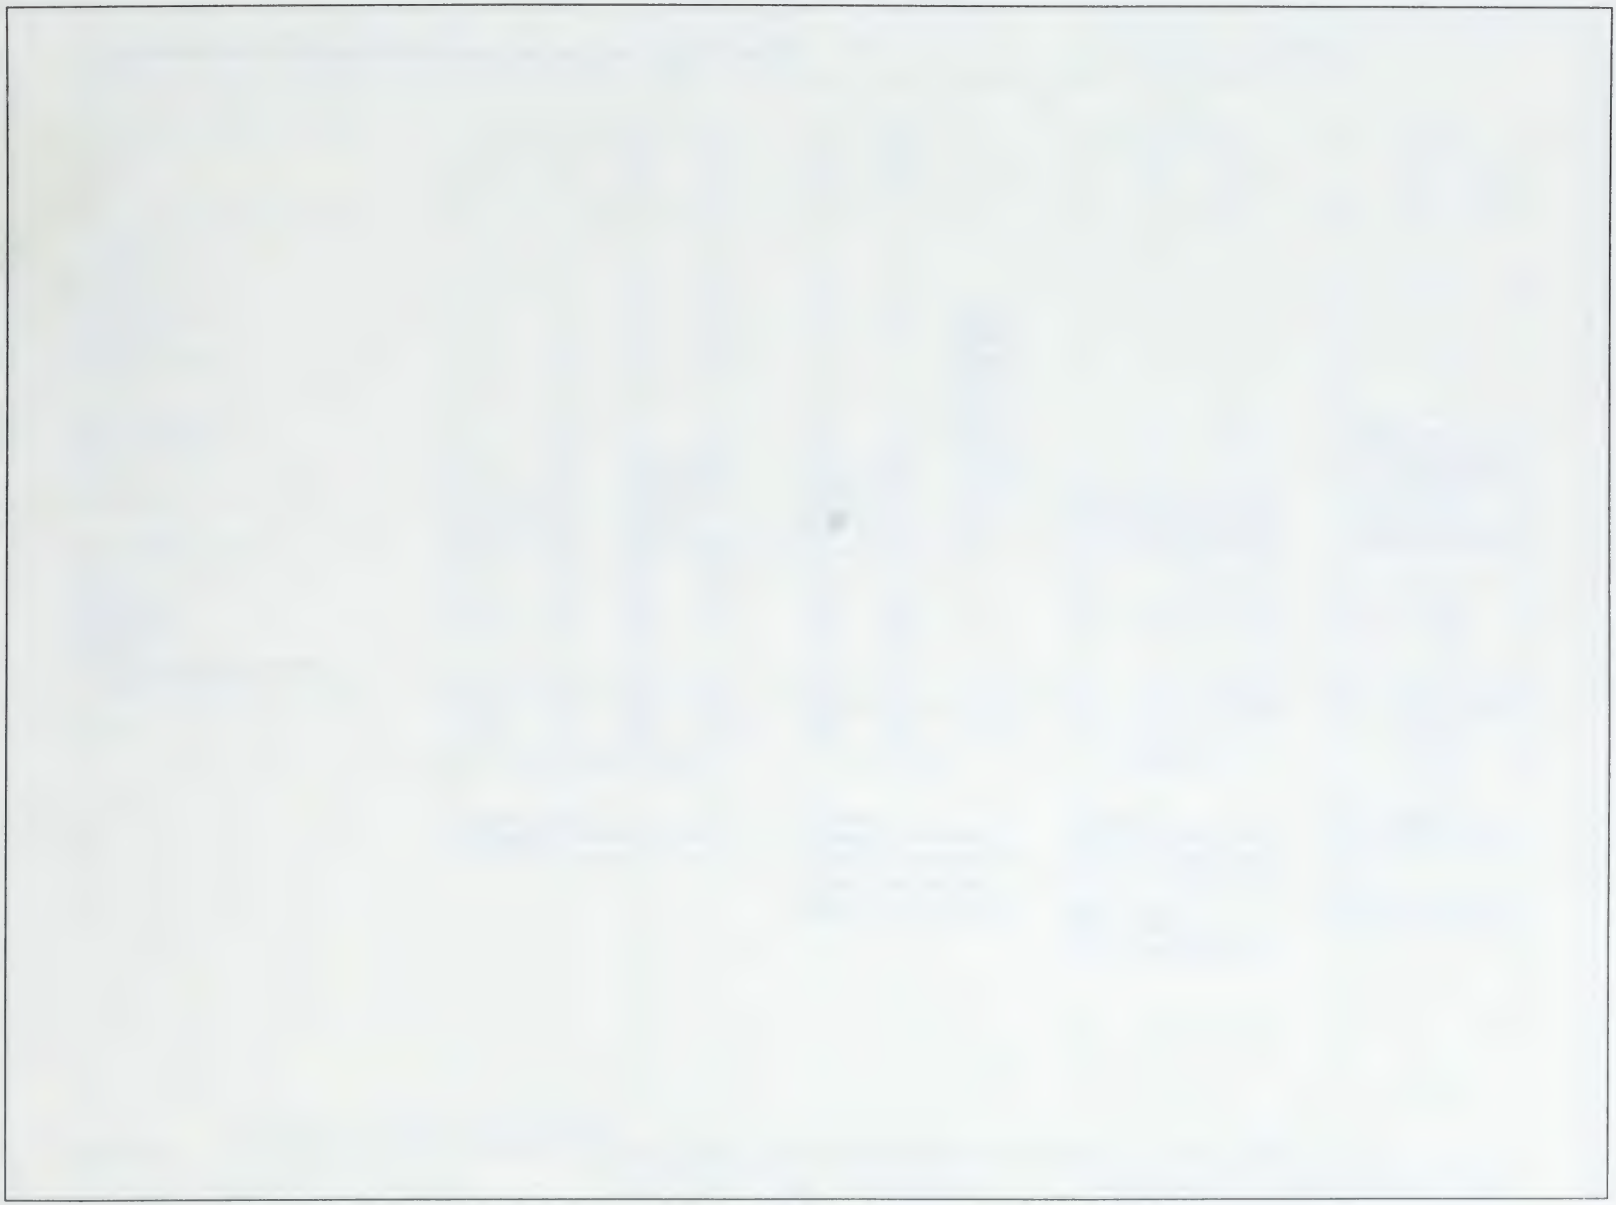
It is important to appreciate that the net operating financial circumstances can change quite markedly from year-to-year. The data presented is for 1987 (i.e. from the 1987 financial statements submitted by municipalities).

The burden of total aggregate costs could shift between general taxation and utility service charges. This will depend on at least two factors: First, whether a municipality chooses to operate its water and sewer utilities at a "loss" or a "profit." Also it depends on whether it chooses to charge for solid waste. Many recover these costs through general taxation which is a form of subsidization. Also, there could be cases of cross-subsidization. For example, sewer rates may be set relatively high to offset comparatively low water rates — or vice versa.

You will note also there is scope for considerable inter-relationship with the municipal tax component of the total property tax bill. For example, a municipality may appear to have comparatively low taxation but high utility charges due to a policy of requiring utilities to be self-financing, thus avoiding any imposition on the general tax base. The reverse situation may also apply where the tax bill is "loaded up" to keep utility charges low (or non-existent with respect to solid waste management). This policy is likely to be most popular in municipalities with a large proportion of elderly people. In some cases this "tax bill loading" practice is done to maximize the benefits to individuals from the property tax reduction programming for senior citizens.

Ideally, utility rates would be set to allow the build-up of operating and capital reserves. These would deal with emergencies and fund major renovations or replacement of deteriorated systems. A pro-active reserves policy by a municipality can stave off the necessity to resort to costly short term borrowing and debenturing for capital works financing. In many cases, however, this has become unavoidable, and significant debt loads are being carried. The debt service costs can be built into the utility rates. High utility rates are often associated with high debt loads. Statistics on the 1987 **per capita Debt Load for water and sewer** have been included in Table IV to assist in an appreciation of this factor.

Averages have not been reported for annual solid waste charges or for the debt per capita for solid waste disposal. The approach to financing the provision of this service varies significantly and averaging was judged to convey information which could be misinterpreted.



PART IV: UTILITY CHARGES: SIGNIFICANCE, UNIT COSTS AND COMPARATIVE NET COSTS/DEBT DATA
USER'S AND TECHNICAL NOTES

- Compare the total and the index with other municipalities to appreciate the burden on residential property.
- Compare the total annual utility charges for each component.
- The standard volume serves as a comparable measure among municipalities.
- If self-financing principle was adhered to, all statistics would be close to zero.
- Negatives = expenditures are greater than revenues. Positives = revenues are greater than expenditures.
- High utility rates are often associated with high debt loads.
- Compare the per capita totals for water and sewer enterprise functions.

Municipality	Per Dwelling: Utility Charges Significance				Annual Unit Costs			Net Annual Costs			Utility Debt		
	Total Aggregate Cost (T.A.C.) ($)	T.A.C. Index (Avg.=100)	Utilities Charges % of T.A.C. (%)	Util. Charges % of T.A.C. Index (Avg.=100)	Water Charges (for 360 cu.m) ($)	Sewer Charges (for 360 cu.m) ($)	Solid Waste Charges ($)	1987 Net Operat. Loss (–)/Gain per Capita Water ($P.C.)	Sewer ($P.C.) SUMMARY OF AVERAGES													
CITIES	1,526		30.0		305	125		7	2	(13)	267	152	
TOWNS	1,390		30.7		275	111		(1)	(2)	(11)	275	176	
VILLAGES	1,033	*****	31.2	*****	212	86		(21)	(8)	(14)	316	208	

- Annual total property taxes plus (+) utility charges per dwelling in cities, towns, and villages.
- Annual utility charges for water, sewer and solid waste (combined) as a percentage of the Total Aggregate Cost.
- Municipal utility rates are applied to a standard volume (360 cu.m.) at an average rate of 30 cu.m. per month.
- Annual charges by the municipality for solid waste service on residential properties have not been averaged due to the small number of municipalities levying this charge.
- Annual operating revenues less expenses divided by municipal population. These financial circumstances can change markedly from year-to-year.
- The Total Debt associated with each function is divided by the population. An average has not been calculated for solid waste due to the small number of municipalities showing indebtedness for this services.

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

APPENDIX 1:

RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

APPENDIX 1: RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

Introduction

The data sets provided in this table are intended to help you compare taxation rate by first identifying similar rural municipalities. The consideration of average taxation per dwelling in rural municipalities is subject to wide ranging possibilities for misinterpretation. Total dwellings may, and usually do, include country residential developments, urban housing in hamlets and one or more dwellings per farm unit. Unfortunately, from available published data it is not possible to specifically determine how many dwellings of each type there are in a rural municipality. In addition, it is not possible to accurately separate country residential taxation from hamlet residential data.

Also, this appendix is organized on the basis of Alberta Agriculture's six regions. The costs of providing municipal services in a rural setting are affected by many factors including local geography, natural resources, climate and settlement pattern. These factors, although not detailed in this report, do need to be considered when comparing rural municipalities.

This appendix includes two density statistics to assist comparative analyses. The first is **Population Per Square Kilometre**. The second statistic is **Road Density**. This measure refers is to local and secondary roads where the rural municipality has some or all the servicing responsibility. (It does not include any primary or forestry roads, nor any roads classed "not open.")

The **Number of Farms** data comes from Alberta Agriculture's "1986 Alberta Census of Agriculture." These statistics, in conjunction with other information on the total number of dwellings (from Alberta Municipal Affairs records), have been used to derive a crude estimate of "**Non-Farm Dwellings**." It is based on an assumption of one dwelling per farm. In some areas, such as those with large Hutterite settlements, this clearly can overestimate the number of non-farm dwellings. These data have permitted the estimation of approximate comparative taxation levels for the average farm and the average non-farm.

Property Tax Per Farm has been estimated from 1987 AMFIS information on the taxes raised from "farmland" properties, divided by the number of census farms. The "non-farm" statistic recognized taxes raised from "residential" properties as well as any special assessments and mobile home licence fee revenue. These "taxes" were divided by the estimate of non-farm dwelling units. Apart from the crudeness of the latter estimates, the value of the unit statistics is heavily dependent on the accurate reporting of the breakdown of property taxes in Schedule FS5 of the Alberta Municipal Affairs financial statements for municipalities. Both sets of unit taxation are complemented with an **Index** referenced to the relevant agricultural region average. These permit an at-a-glance relative positioning of individual municipalities.

The Fiscal Capacity statistics furnish the means to begin to explain the differences observed in the unit taxation data. **Equalized Assessment Per Kilometre** is of particular significance for rural municipalities because of the importance of the road maintenance/construction function (often accounting for around two-thirds of total operating expenditures). An appreciation of the quality of the average farm is provided in the measure of **Farmland Equalized Assessment Per Farm**. Similarly, the quality of the average non-farm residence is indicated by the measure of **Non-Farm Residential Equalized Assessment Per Non-Farm Residence**.

Relatively high levels of fiscal capacity by any of these three measures signifies the likelihood of high service level expectations and high tax rate tolerances, and vice versa. A useful profile of each rural municipality can be quickly obtained by reference to the equalized assessment composition statistics. Fundamental differences are readily apparent in the contrasting significance of **Farmland, Non-Farm Residential development, and non-residential (industrial/E.P.P.L/machinery and equipment/corporate farms) assessment**. The better-off rural residents are those with a high percentage of non-residential assessment to share their tax burden. Complex situations are created where there are high levels of non-farm residential development (e.g. acreages,

country estates, hobby farms).

Rural municipalities with farmland dominating their assessment are now the exception rather than the rule. However, most continue to exert a strong farmland dominance over non-farm residential development, and some also have healthy levels of non-residential assessment.

APPENDIX 1: RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX
USER'S AND TECHNICAL NOTES

- Compare these characteristics with other rural municipalities within and between regions.
- Compare farm and non-farm annual property taxes using the totals and the indices.
- Compare these fiscal capacities with the region's average.
- High levels of fiscal capacity by any of these measures signify the likelihood of high service level expectations.
- The best-off residents have a high percentage of S.F.P.F. assessment to share their tax burden.
- Compare the levels of non-farm residential developments and contrast it with the farmland dominance.

- Alberta Agriculture's six Census Regions.
- The municipal population (Alberta Municipal Affairs Oct. '88) divided by the area (AMFIS).
- Roads refers to all open local and secondary roads for which a municipality has some responsibility. (It does not include primary or forestry roads.)
- Number of farms reported in Alberta Agriculture's 1986 Census.
- Those dwellings not related to a farm such as country residential, hamlets and summer resorts. This crude estimate involves: the total number of dwellings (AMFIS '87) minus the number of farms.
- Taxes from "farmland" properties in a municipality (AMFIS '87) divided by the number of census farms.
- Taxes from "residential" properties, special assessments and mobile home licence fee revenues divided by the estimated non-farm dwellings.
- Road construction is a significant expenditure for rural municipalities. Equalized assessment is the base on which taxes to recover the net costs will be levied. N.B. The large average for the South Central Region is due to I.D. #5's E.A./Rd.KM.
- Indicates the quality of the average farm and non-farm residence.
- Refer to introduction of Appendix for details.
- This is the industrial portion (industrial, E.P. & P.L., machinery and equipment, corporate farm) of the assessment.

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

APPENDIX 2:

SELECTED SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA

APPENDIX 2: SELECTED SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA

Introduction

In this Appendix, a range of school jurisdiction data helps you to gain a greater appreciation of the variations in supplementary school taxes featured in Part III. This Appendix details the scale of operations, resource base and fiscal capacity of the individual school jurisdictions. The data presented have been obtained from Finance and Support Services, Alberta Education.

This Appendix includes information on all operating and non-operating school jurisdictions. Non-operating school jurisdictions still tax but do not operate their own schools. These districts send their students to the nearest operating jurisdiction. Blank spaces in the expenditure columns denote non-operating school jurisdictions.

The **school jurisdiction designation (Zone, Code, Name and Number)** identifies the location and status of each school district. The Coded Identification is detailed in the School Jurisdiction section of the User's Guide. It also identifies the predominant school system in each municipality.

The scale of each jurisdiction may be appreciated by the **Number of Schools Operated**, the **Resident Pupil Count**, the **Adjusted Equalized Assessment**, and **Total Operating Expenditures**.

The **Adjusted Equalized Assessment** data are for the purposes of education finance. It reflects an adjustment for the **Electric Power and Pipe-Line (E.P.P.L.)** assessment in the rural municipality which is part of a school jurisdiction. The Adjusted Equalized Assessment includes an allocation of the E.P.P.L. assessment among the school jurisdictions that are operating within a rural municipality. To the extent that E.P.P.L. assessment is present, all supporters of the particular jurisdiction are better off. The adjusted equalized assessment is the sum of the actual equalized assessment, contributed by each supporting municipality, and an imputed equalized assessment value based on the application of the net mill rate to the E.P.P.L. tax contributed by the rural municipalities. The formula is as follows:

Adjusted Equalized Assessment = Actual Eq. Ass. + [(E.P.P.L. Tax / Net Mill Rate) x 1000].

The significance of the E.P.P.L. factor is brought out in the statistic showing the **Adjusted Equalized Assessment as a Percentage of the Actual Equalized Assessment**.

The **fiscal capacity** of each jurisdiction is indicated in terms of **Adjusted Equalized Assessment per Resident Pupil**. This will have a strong bearing on the amount of supplementary requisition established by a school authority. Those with a strong fiscal capacity are in a position to make a comparatively large requisition in per pupil terms. Those with a weak capacity (e.g. below average) do not have this option unless they are prepared to set a very high school tax rate. However, some flexibility may be available depending on the significance of the E.P.P.L. contribution. Appendix 2 includes comparative data on the **percentage of the total requisition covered by E.P.P.L.**

Other comparative statistics include the level of **Supplementary Requisitions per Resident Pupil** served, and the **Net Mill Rate**. The latter is probably the best single comparative indicator of the school tax burden for residential property-owners.

The Net Mill Rate is computed as follows:

Net Mill Rate = [(Supp Req. P E.P.P.L. Tax) / (Actual Eq. Ass.)] x 1000.

To round out the picture, information is presented on **Operating Expenditures** by each school jurisdiction (1986/87 data). The statistics show both the level of **Expenditure Per Enrolled Pupil**, and this **expenditure in relation to the adjusted equalized assessment**. Much of the expenditure is covered by provincial grants designed to ensure at least a foundation level of education for each pupil regardless of the jurisdiction. There is, therefore, comparatively little variability in per pupil expenditures. However, because of the wide range in fiscal capacity, the expenditure effort statistics do vary considerably.

APPENDIX 2: SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA
USER'S AND TECHNICAL NOTES

- As referenced in the User's Guide, select the school authority using its zone, code, name and number.
- The scale of each jurisdiction is gained from this data and the total operating expenditure.
- Adjusted Equalized Assessment includes an allocation of E.P. & P.L. assessment among school jurisdictions operating within a rural municipality.
- The significance of the E.P. & P.L. factor is brought out in the Adj. E.A. as a % of the Actual E.A.
- The higher the number the greater the capacity to bear the supplementary school requisition.
- Compare the totals and the statistics to appreciate the level of expenditures and the related expenditure effort.

- The first digit is the status of the school authority. The other three digits specify the jurisdiction (for details see the School Jurisdiction section of the User's Guide).
- Alberta Education Zone, one of six in Alberta.
- The Equalized Assessment is adjusted to include the electric power and pipeline (EP & PL) portion.
- By including the EP & PL this total is greater than the Total E.A.
- A fiscal capacity indicator is derived by dividing the Adj. E.A. by the resident pupils.
- Net Mill Rate = [(Supplementary Requisition – EP & PL Tax) /Actual E.A.] * 1000

*Expenditure data refer to a September 1, 1986 to August 31, 1987 school year, except in those cases indicated by an *, denoting a January 1 to December 31, 1986 calendar year.
